# viral-ngs Documentation

Release v2.1.33.16

**Broad Institute Viral Genomics** 

# **CONTENTS**

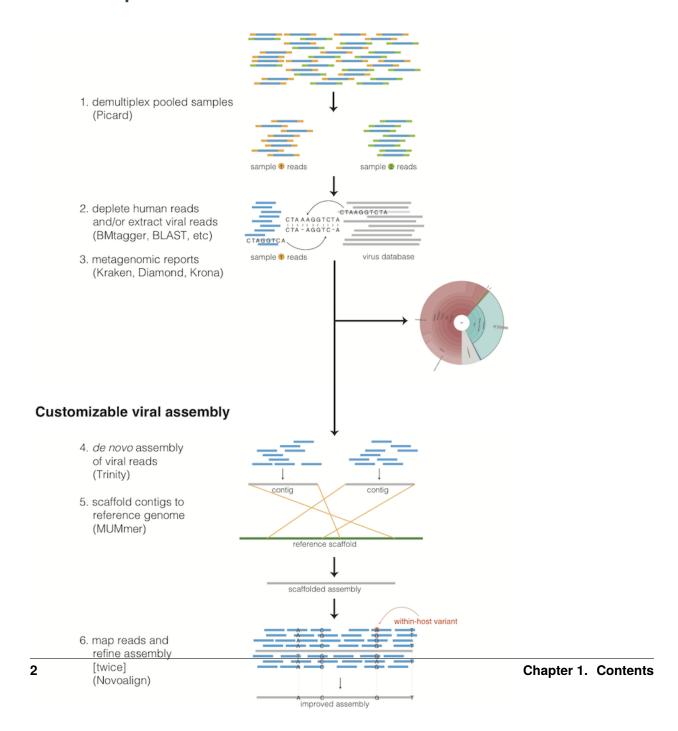

1	Contents				
	1.1	Description of the methods	2		
	1.2	Using the WDL pipelines	4		
	1.3	Submitting viral sequences to NCBI	4		
	1 4	WDL Workflows	6		

**CHAPTER** 

**ONE** 

# **CONTENTS**

# 1.1 Description of the methods

#### 1.1.1 Taxonomic read filtration

#### Human, contaminant, and duplicate read removal

The assembly pipeline begins by depleting paired-end reads from each sample of human and other contaminants using BMTAGGER and BLASTN, and removing PCR duplicates using M-Vicuna (a custom version of Vicuna).

#### **Taxonomic selection**

Reads are then filtered to to a genus-level database using LASTAL, quality-trimmed with Trimmomatic, and further deduplicated with PRINSEQ.

### 1.1.2 Viral genome analysis

#### Viral genome assembly

The filtered and trimmed reads are subsampled to at most 100,000 pairs. *de novo* assemby is performed using SPAdes. Reference-assisted assembly improvements follow (contig scaffolding, orienting, etc.) with MUMMER and MUSCLE or MAFFT. Gap2Seq is used to seal gaps between scaffolded *de novo* contigs with sequencing reads.

Each sample's reads are aligned to its *de novo* assembly using Novoalign and any remaining duplicates were removed using Picard MarkDuplicates. Variant positions in each assembly were identified using GATK IndelRealigner and UnifiedGenotyper on the read alignments. The assembly was refined to represent the major allele at each variant site, and any positions supported by fewer than three reads were changed to N.

This align-call-refine cycle is iterated twice, to minimize reference bias in the assembly.

#### Intrahost variant identification

Intrahost variants (iSNVs) were called from each sample's read alignments using V-Phaser2 and subjected to an initial set of filters: variant calls with fewer than five forward or reverse reads or more than a 10-fold strand bias were eliminated. iSNVs were also removed if there was more than a five-fold difference between the strand bias of the variant call and the strand bias of the reference call. Variant calls that passed these filters were additionally subjected to a 0.5% frequency filter. The final list of iSNVs contains only variant calls that passed all filters in two separate library preparations. These files infer 100% allele frequencies for all samples at an iSNV position where there was no intra-host variation within the sample, but a clear consensus call during assembly. Annotations are computed with snpEff.

#### 1.1.3 Taxonomic read identification

Metagenomic classifiers include Kraken and Diamond. In each case, results are visualized with Krona.

# 1.2 Using the WDL pipelines

Rather than chaining together viral-ngs pipeline steps as series of tool commands called in isolation, it is possible to execute them as a complete automated pipeline, from processing raw sequencer output to creating files suitable for GenBank submission. This utilizes the Workflow Description Language, which is documented at: https://github.com/openwdl/wdl

There are various methods for executing these workflows on your infrastructure which are more thoroughly documented in our README.

# 1.3 Submitting viral sequences to NCBI

### 1.3.1 Register your BioProject

If you want to add samples to an existing BioProject, skip to Step 2.

- 1. Go to: https://submit.ncbi.nlm.nih.gov and login (new users create new login).
- 2. Go to the Submissions tab and select BioProject click on New Submission.
- 3. Follow the onscreen instructions and then click submit you will receive a BioProject ID (PRJNA###) via email almost immediately.

### 1.3.2 Register your BioSamples

- 1. Go to: https://submit.ncbi.nlm.nih.gov and login.
- 2. Go to the Submissions tab and select BioSample click on New Submission.
- 3. Follow instructions, selecting "batch submission type" where applicable.
- 4. The metadata template to use is likely: "Pathogen affecting public health" (Pathogen.cl.1.0.xlsx).
- 5. Follow template instructions to fill in the sheet. Pay particular attention to the Excel comments that are attached to each column header: they describe the intended content for these columns, the valid formatting, and controlled vocabulary.
  - a. For example, "organism" should always match the long name that is given by the NCBI Taxonomy database for that species.
  - b. Date fields seem to have multiple acceptable formats, but we prefer ISO8601 (YYYY-MM-DD) just to reduce ambiguity. Note that this format will trigger a warning when uploading, if you don't have HH:MM time values as well (it will suggest an edit for you).
  - c. You will likely need to duplicate your sample\_name to the host\_subject\_id column (or something like it)—if you do not, then any samples that happen to have the same attribute values will trigger an error when trying to register new BioSamples because they look like duplicates. Assuming that your sample\_names are one-to-one corresponding to a human patient, host\_subject\_id is probably the most appropriate place to duplicate the value in order to make all entries unique.
  - d. Populate the isolate column using the naming convention you want to apply to this organism (most viral species have a specific, structured naming convention you should follow). Our workflow will re-use this value for the Genbank record name.
- 6. Export to text and submit as .txt file. You will receive BioSamples IDs (SAMN####) via email (often 1-2 days later).

- 7. After NCBI accepts your submission and registers your samples, retrieve the text-formatted "attributes table" associated with this submission from the portal at https://submit.ncbi.nlm.nih.gov/subs/ and clicking on "Download attributes file with BioSample accessions". You will need this file later. Do not use the file that was attached to the NCBI response email—it does not contain the full record and is formatted differently.
- 8. If you wish to amend/correct any metadata in your submissions, you can always do so at a future time however, you will need BioSample IDs before any of the following steps, so it's best to register as soon as you have collection\_date and sample\_name for everything. This can be a super-set of anything you submit to NCBI in the future (Genbank or SRA), so we typically register BioSamples for every viral sample we *attempt* to sequence, regardless of whether we successfully sequenced it or not.

### 1.3.3 Set up an NCBI author template

If different author lists are used for different sets of samples, create a new .sbt file for each list

- 1. Go to: https://submit.ncbi.nlm.nih.gov/genbank/template/submission/
- 2. Fill out the form including all authors and submitter information (if unpublished, the reference title can be just a general description of the project).
- 3. At the end of the form, include the BioProject number from Step 1 but NOT the BioSample number'
- 4. Click "create template" which will download an .sbt file to your computer'
- 5. Save file as "authors.sbt" or similar. If you have multiple author files, give each file a different name and prep your submissions as separate batches, one for each authors.sbt file.

### 1.3.4 Prepare requisite input files for your submission batches

- 1. Stage the above files you've prepared and other requisite inputs into the environment you plan to execute the *genbank* WDL workflow. If that is Terra, push these files into the appropriate GCS bucket, if DNAnexus, drop your files there. If you plan to execute locally (e.g. with miniwdl run), move the files to an appropriate directory on your machine. The files you will need are the following:
  - a. The files you prepared above: the submission template (authors.sbt) and the biosample attributes table (attributes.tsv).
  - b. All of the assemblies you want to submit. These should be in fasta files, one per genome. Multi-segment/multi-chromosome genomes (such as Lassa virus, Influenza A, etc) should contain all segments within one fasta file.
  - c. Your reference genome, as a set of fasta files, one per segment/chromosome. The fasta sequence headers should be Genbank accession numbers. This can come directly from Genbank.
  - d. Your reference gene annotations, as a set of TBL files, one per segment/chromosome. These must correspond to the accessions in your reference genome. These must be presented in the same order as the reference genome fasta files, which must also be in the same order as all the sequences in all of your assembled fasta files.
  - e. A genome coverage table as a two-column tabular text file (optional, but helpful).
  - f. The organism name (which should match what NCBI taxonomy calls the species you are submitting for). This is a string input to the workflow, not a file.
  - g. The sequencing technology used. This is a string input, not a file.
  - h. The NCBI Taxonomy taxid. This is a numeric input, not a file.
- 2. The reference genome you provide should be annotated in the way you want your genomes annotated on NCBI. If one doesn't exist, see the addendum below about creating your own feature list.

3. Note that you will have to run the pipeline separately for each virus you are submitting AND separately for each author list.

### 1.3.5 Run the genbank submission pipeline

- 1. Run the *genbank* WDL workflow. Most of the metadata files described above (BioSample map, source modifier table, genome coverage table) are allowed to be a super-set of the samples you are submitting—the extra metadata will be ignored by the workflow. The samples that are included in this batch are the ones you provide to the assemblies\_fasta input field. Any missing samples in the metadata inputs should not cause failures, but will produce less descriptive submission files. Viral genomes should set molType to cRNA.
- 2. The *genbank* workflow performs the following steps: it aligns your assemblies against a Genbank reference sequence, transfers gene annotation from that Genbank reference into your assemblies' coordinate spaces, and then takes your genomes, the transferred annotations, and all of the sample metadata prepared above, and produces a zipped bundle that you send to NCBI. There are two zip bundles: sequins\_only.zip is the file to email to NCBI. all\_files.zip contains a full set of files for your inspection prior to submission.
- 3. In the all\_files.zip output, for each sample, you will see a .sqn, .gbf, .val, and .tbl file. You should also see an errorsummary.val file that you can use to check for annotation errors (or you can check the .val file for each sample individually). Ideally, your samples should be error-free before you submit them to NCBI unless you're confident enough in the genomic evidence for unusual coding effects and frameshifts. For an explanation of the cryptic error messages, see: https://www.ncbi.nlm.nih.gov/genbank/genome\_validation/.
- 4. We currently use a bioconda wrapper of NCBI's *tbl2asn* tool called *tbl2asn-forever*. This works around some deficiencies in NCBI's tool but has the side effect of setting the submission date to Jan 1, 2019 for all submission, regardless of today's date. Unfortunately, until NCBI releases a fixed tool, you will need to search-replace the date in the SQN files in a text editor prior to submission.
- 5. Check your .gbf files for a preview of what your genbank entries will look like. Once you are happy with your files email the sequins\_only.zip file to gb-sub@ncbi.nlm.nih.gov.
- 6. It often takes 2-8 weeks to receive a response and accession numbers for your samples. Do follow up if you haven't heard anything for a few weeks!

### 1.4 WDL Workflows

Documentation for each workflow is provided here. Although there are many workflows that serve different functions, some of the primary workflows we use most often include:

- demux\_plus (on every sequencing run)
- classify multi (metagenomics & host depletion)
- assemble denovo (for most viruses)
- assemble\_refbased (for less diverse viruses, such as those from single point source human outbreaks)
- augur\_from\_assemblies (for nextstrain-based visualization of phylogeny)
- genbank (for NCBI Genbank submission)

# 1.4.1 align\_and\_count\_report

Align reads to reference with minimap2 and count the number of hits. Results are returned in the format of 'samtools idxstats'.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

# 1.4.2 align\_and\_count\_multiple\_report

Count the number of times reads map to provided reference sequences. Useful for counting spike-ins, etc.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.3 align\_and\_plot

Align reads to reference and produce coverage plots and statistics.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.4 amplicon16S analysis

Running 16S amplicon (from BAM format) sequencing analysis with qiime.

**Inputs** 

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.5 assemble denovo

Assisted de novo viral genome assembly from raw reads.

**Inputs** 

**Required inputs** 

Other common inputs

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.6 assemble\_refbased

Reference-based microbial consensus calling. Aligns NGS reads to a singular reference genome, calls a new consensus sequence, and emits: new assembly, reads aligned to provided reference, reads aligned to new assembly, various figures of merit, plots, and QC metrics. The user may provide unaligned reads spread across multiple input files and this workflow will parallelize alignment per input file before merging results prior to consensus calling.

Inputs

**Required inputs** 

Other common inputs

Other inputs

**Outputs** 

### 1.4.7 augur export only

Convert a newick formatted phylogenetic tree with other config settings and node values into a json suitable for auspice visualization. See https://nextstrain-augur.readthedocs.io/en/stable/usage/cli/export.html

**Inputs** 

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.8 augur\_from\_assemblies

Align assemblies, build trees, and convert to json representation suitable for Nextstrain visualization. See https://nextstrain.org/docs/getting-started/ and https://nextstrain-augur.readthedocs.io/en/stable/

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.9 augur\_from\_beast\_mcc

Visualize BEAST output with Nextstrain. This workflow converts a BEAST MCC tree (.tree file) into an Auspice v2 json file. See https://nextstrain-augur.readthedocs.io/en/stable/faq/import-beast.html for details.

**Inputs** 

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.10 augur from mltree

Take a premade maximum likelihood tree (Newick format) and run the remainder of the augur pipeline (timetree modifications, ancestral inference, etc) and convert to json representation suitable for Nextstrain visualization. See https://nextstrain.org/docs/getting-started/ and https://nextstrain-augur.readthedocs.io/en/stable/

#### **Inputs**

**Required inputs** 

Other inputs

#### **Outputs**

Generated using WDL AID (1.0.0)

### 1.4.11 augur\_from\_msa

Build trees, and convert to json representation suitable for Nextstrain visualization. See https://nextstrain.org/docs/getting-started/ and https://nextstrain-augur.readthedocs.io/en/stable/

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.12 bams\_multiqc

Run FastQC on a set of BAM files, and then MultiQC to summarize all outputs.

**Inputs** 

**Required inputs** 

Other inputs

**Outputs** 

# 1.4.13 beast\_gpu

Runs BEAST (v1) on a GPU instance. Use with care—this can be expensive if run incorrectly.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.14 calc bam read depths

Generates read depth tables.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.15 classify\_kaiju

Taxonomic classification of reads with kaiju.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.16 classify kraken2

Taxonomic classification of sequences via kraken2 (or kraken2x, depending on the database provided).

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.17 classify\_krakenuniq

Taxonomic classification of reads using krakenuniq v1.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.18 classify\_multi

Runs raw reads through taxonomic classification (Kraken2), human read depletion (based on Kraken2), de novo assembly (SPAdes), and FASTQC/multiQC of reads.

**Inputs** 

**Required inputs** 

Other inputs

**Outputs** 

# 1.4.19 classify\_single

Runs raw reads through taxonomic classification (Kraken2), human read depletion (based on Kraken2), de novo assembly (SPAdes), and FASTQC/multiQC of reads.

**Inputs** 

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

# **1.4.20** contigs

**Inputs** 

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

# 1.4.21 coverage\_table

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.22 demux\_deplete

Picard-based demultiplexing and basecalling from a tarball of a raw BCL directory, followed by QC metrics, depletion, and SRA submission prep.

**Inputs** 

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.23 demux\_metag

**Inputs** 

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.24 demux\_only

Picard-based demultiplexing and basecalling from a tarball of a raw BCL directory.

**Inputs** 

**Required inputs** 

Other inputs

**Outputs** 

14

# 1.4.25 demux\_plus

Picard-based demultiplexing and basecalling from a tarball of a raw BCL directory, followed by basic metagenomics and QC metrics. Intended for automatic triggering post upload on DNAnexus.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.26 deplete\_only

Taxonomic depletion of reads matching unwanted taxa (such as human).

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.27 detect cross contamination

Detect cross-contamination between samples using consensus-level and sub-consensus variation.

**Inputs** 

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

# 1.4.28 detect\_cross\_contamination\_precalled\_vcfs

Detect cross-contamination between samples using consensus-level and sub-consensus variation, from consensus genomes and pre-called LoFreq vcf files.

**Inputs** 

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.29 diff\_genome\_sets

**Inputs** 

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

# 1.4.30 downsample

Random subsampling of reads.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

# 1.4.31 fastq\_to\_ubam

Convert reads from fastq format (single or paired) to unaligned BAM format.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.32 fetch\_annotations

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.33 fetch sra to bam

Retrieve reads from the NCBI Short Read Archive in unaligned BAM format with relevant metadata encoded.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.34 filter classified bam to taxa

Taxonomic filtration of reads utilizing output from a classifier such as kraken1/2/uniq. Can filter out or filter to a specified taxonomic grouping.

**Inputs** 

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.35 filter\_sequences

Filter and subsample a sequence set. See https://nextstrain-augur.readthedocs.io/en/stable/usage/cli/filter.html

**Inputs** 

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.36 genbank

Prepare assemblies for Genbank submission. This includes annotation by simple coordinate transfer from Genbank annotations and a multiple alignment. See https://viral-pipelines.readthedocs.io/en/latest/ncbi\_submission.html for details.

**Inputs** 

**Required inputs** 

Other common inputs

Other inputs

**Outputs** 

# 1.4.37 isnvs\_lofreq

variant calls by LoFreq against reference\_fasta

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.38 isnvs\_merge\_to\_vcf

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.39 isnvs one sample

Intrahost variant calling with V-Phaser2. Requires an assembled genome and a BAM of aligned reads against that same genome.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

# 1.4.40 kraken2\_build

Build a Kraken2 (or 2X) database.

Inputs

**Required inputs** 

Other inputs

#### **Outputs**

Generated using WDL AID (1.0.0)

#### 1.4.41 mafft

MAFFT multiple-alignment for a set of possibly multi-segment genomes.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.42 mafft\_and\_snp

Align assemblies with mafft and find SNPs with snp-sites.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

### 1.4.43 mafft and snp annotated

Align assemblies with mafft and find SNPs with snp-sites.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.44 mafft and trim

MAFFT based multiple alignment followed by trimal-based edge trimming.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

#### 1.4.45 merge bams

Merge, reheader, or merge-and-reheader BAM files.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.46 merge\_metagenomics

Combine metagenomic reports from single samples into an aggregate report.

Inputs

**Required inputs** 

Other inputs

#### **Outputs**

Generated using WDL AID (1.0.0)

# 1.4.47 merge\_tar\_chunks

Combine multiple tar files (possibly compressed by gzip, bz2, lz4, zstd, etc) into a single tar file. Originally meant for combining streaming upload chunks from a sequencing run.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.48 merge\_vcfs

Merge VCFs from multiple samples using GATK3.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

### 1.4.49 merge vcfs and annotate

Merge VCFs emitted by GATK UnifiedGenotyper and annotate with snpEff.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.50 metagenomic\_denovo

Assisted de novo viral genome assembly (SPAdes, scaffolding, and polishing) from metagenomic raw reads. Runs raw reads through taxonomic classification (Kraken2), human read depletion (based on Kraken2 and optionally using BWA, BLASTN, and/or BMTAGGER databases), and FASTQC/multiQC of reads.

Inputs

**Required inputs** 

Other common inputs

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.51 multiqc\_only

Combine multiple FastQC reports into a single MultiQC summary.

**Inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

# 1.4.52 nextclade\_single

Run Nextclade on a single genome

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.53 qiime\_import\_bam

Importing BAM files into QIIME

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

# 1.4.54 sarscov2\_batch\_relineage

Re-call Nextclade and Pangolin lineages on a flowcell's worth of SARS-CoV-2 genomes

Inputs

**Required inputs** 

Other inputs

**Outputs** 

### 1.4.55 sarscov2 biosample load

Load Broad CRSP metadata and register samples with NCBI BioSample. Return attributes table, id map, etc.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

#### 1.4.56 sarscov2 data release

Submit data bundles to databases and repositories

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

#### 1.4.57 sarscov2 genbank

Prepare SARS-CoV-2 assemblies for Genbank submission. This includes QC checks with NCBI's VADR tool and filters out genomes that do not pass its tests.

**Inputs** 

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.58 genbank dump

Inputs

**Required inputs** 

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.59 sarscov2 gisaid ingest

Sanitize data downloaded from GISAID for use in Nextstrain/augur. See: https://nextstrain.github.io/ncov/data-prep#curate-data-from-the-full-gisaid-database

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.60 sarscov2\_illumina\_full

Full SARS-CoV-2 analysis workflow starting from raw Illumina flowcell (tar.gz) and metadata and performing assembly, spike-in analysis, qc, lineage assignment, and packaging for data release.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

### 1.4.61 sarscov2 lineages

Call Nextclade and Pangolin lineages on a single SARS-CoV-2 genome

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

#### 1.4.62 sarscov2 nextclade multi

Create Nextclade visualizations on many SARS-CoV-2 genomes

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

#### 1.4.63 sarscov2 nextstrain

Align assemblies, build trees, and convert to json representation suitable for Nextstrain visualization. See https://nextstrain.org/docs/getting-started/ and https://nextstrain-augur.readthedocs.io/en/stable/

**Inputs** 

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.64 sarscov2 nextstrain aligned input

Take aligned assemblies, build trees, and convert to json representation suitable for Nextstrain visualization. See https://nextstrain.org/docs/getting-started/ and https://nextstrain-augur.readthedocs.io/en/stable/

#### **Inputs**

**Required inputs** 

Other inputs

#### **Outputs**

Generated using WDL AID (1.0.0)

### 1.4.65 sarscov2\_sequencing\_reports

Produce per-state and per-collaborator weekly reports of SARS-CoV-2 surveillance data.

#### **Inputs**

**Required inputs** 

#### Other inputs

#### **Outputs**

Generated using WDL AID (1.0.0)

# 1.4.66 sarscov2\_sra\_to\_genbank

Full SARS-CoV-2 analysis workflow starting from SRA data and metadata and performing assembly, spike-in analysis, qc, lineage assignment, and packaging assemblies for data release.

#### **Inputs**

**Required inputs** 

#### Other inputs

#### **Outputs**

### 1.4.67 scaffold and refine

Scaffold de novo contigs against a set of possible references and subsequently polish with reads.

Inputs

**Required inputs** 

Other common inputs

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.68 subsample by metadata

Filter and subsample a sequence set. See https://nextstrain-augur.readthedocs.io/en/stable/usage/cli/filter.html

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

### 1.4.69 subsample by metadata with focal

Filter and subsample a global sequence set with a bias towards a geographic area of interest.

Inputs

**Required inputs** 

Other inputs

**Outputs** 

Generated using WDL AID (1.0.0)

# 1.4.70 terra\_table\_to\_tsv

Download data table in Terra workspace to tsv file.

Inputs

**Required inputs** 

Other inputs

#### **Outputs**

Generated using WDL AID (1.0.0)
